NVEX

WHITEPAPER

BHCT Whitepaper

NVEX's token pursuing integration with the creator–brand ecosystem

Version	v1.5
Issued	November 5, 2026
Issuer	NVEX Foundation
Language	English (the Korean version prevails)
Latest version	https://nvex.attackgo.com/en/whitepaper

Important notice

This whitepaper provides information about BHCT and Zetaverse and is not investment, financial, legal or tax advice. It does not solicit the sale or purchase of BHCT in any country or region.

The NVEX Foundation does not promise or forecast BHCT's price or returns. Virtual assets are highly volatile, you may lose everything, and regulation differs by country.

Plans and designs in this document reflect the time of writing and may change. The latest version at the address below and the disclosure board are the reference. On-chain values in tables were read at the time stated with each table.

Document information

Version	v1.5
Issued	November 5, 2026
Issuer	NVEX Foundation
Earlier versions	v1.4 (2026-11-05), v1.3 (2026-11-05), v1.2 (2026-11-05), v1.1 (2026-11-04), v1.0 (2026-11-04)
Changes	Turned the Stage 1 pilot figures (reward amounts by contribution, service catalog prices and capacity, quarterly distribution budget) into tables linked to the admin settings. Each table shows its status (proposed or confirmed) and as-of date, the token page shows the same values, and quarterly adjustments are made by updating these values with a disclosure rather than publishing a new whitepaper version. Added the principle that prices are set in BHCT amounts and not tied to a market price, with a related FAQ. The figures themselves are unchanged from v1.4.

1. Introduction

BHCT is the NVEX Foundation's token, a BEP-20 token issued on BNB Smart Chain. Zetaverse is a creator–brand campaign platform run by a separate operator. The NVEX Foundation is pursuing an integration partnership with that operator and designing BHCT uses for creator rewards, campaign payments, service use and fan participation.

> This whitepaper is for information only and is not investment advice. The NVEX Foundation does not promise or forecast BHCT's price or returns. Plans may change; material changes are posted with a date on the disclosure board (https://nvex.attackgo.com/en/disclosures). Please read the risk notice (https://nvex.attackgo.com/en/risk) before making any decision.

1.1 At a glance

Item	Details
Project	NVEX (NVEX Foundation)
Token	BHCT · BEP-20 · BNB Smart Chain
Ecosystem	Proposed BHCT integration with Zetaverse: a separately operated creator–brand campaign platform running in Malaysia
Supply	Initial supply 1,000,000,000 BHCT, no mint function
Token economy	Distributed for verified contributions → used for ecosystem services and access → spent tokens recovered to the reward pool and distributed again (design)
Current status	This version proposes an allocation plan that is not yet confirmed, and most of the supply sits in the treasury wallet. Creator rewards are in preparation with payout tools in place; the other uses are in design.

1.2 The role of BHCT

BHCT is the **contribution-reward and utility token** of the Zetaverse ecosystem. It is distributed for the contributions that turn creators into supply brands can actually use (finishing training, on-time delivery, performance reports), spent on preparation services and access in the ecosystem, and spent tokens return to the reward pool to fund the next contribution rewards. Contractual pay and costs stay in cash; contribution rewards and ecosystem use run on BHCT. The full design is in Token economy (https://nvex.attackgo.com/en/whitepaper/token-economy).

1.3 Principles of this document

- Only working features are described as "Live"; anything still being designed is labelled as in design.

- Values that can be checked on-chain, such as supply and circulating supply, are shown exactly as read from the chain.
- We make no promises or forecasts about price, returns or tradability.
- Anything not yet decided (allocation plan, the foundation's registered name, etc.) is marked "to be announced", and announced through a new version and a disclosure once decided.

1.4 Scope of the proposed operating model

This version uses Zetaverse's business materials to develop a proposed operating model and design direction for readiness assessment, service deliverables, campaign economics, performance measurement, stage gates and BHCT reward procedures. This is a proposal to review and agree with the operator, rather than a statement of completed features, results or signed contracts. The status tables in each chapter describe confirmed token specifications and current operations. Version 1.4 adds the Token economy (https://nvex.attackgo.com/en/whitepaper/token-economy) chapter, which ties supply, distribution, use and recovery into one circular structure, a proposed allocation plan, and proposed Stage 1 pilot figures (reward amounts by contribution, catalog prices and capacity, and the first quarterly budget). Version 1.5 turns these figures into tables linked to the admin settings, so quarterly adjustments are updated with a disclosure rather than a new whitepaper version.

Business source materials versus the new token proposal

The source business materials describe TRAIN → FILTER → PACKAGE → DEPLOY → REPORT, custom brand deals, performance data, selected IP and fan participation, and regional hubs. Creator Profile Clinic, Production Support, optional additional BHCT rewards, service payments and reallocation, budgets, monthly reconciliation and pilot-exit rules, and the token economy (distribution criteria, brand-designated performance bonuses, the ecosystem receiving wallet, the annual distribution cap and the proposed allocation) in this document are a newly proposed operating model built around that business flow. They are not launched or contractually agreed features. The direction is to agree entities, roles, funding, catalogs and terms, then validate them in a limited pilot.

1.5 About this document

This whitepaper is versioned. The version, issue date and issuer are shown above the contents, and the changes in each version are listed in the changelog (https://nvex.attackgo.com/en/whitepaper/changelog). A published version is never edited; changes are published as a new version.

2. Background

Creator marketing has become strategically important to brands as creators gain influence over how consumers discover products, form opinions and decide what to buy. Yet the way it is run is still fragmented. The problem is not the number of creators; it is the supply of creators that brands can actually use.

2.1 What brands struggle with

- Finding creators who fit a real brief, rather than simply large follower counts, is slow.
- Vetting quality, negotiating terms, managing delivery and measuring results take a lot of time and money.
- Deadlines, revisions, brand safety and reporting vary from creator to creator.
- There is no repeatable way to source creators across categories and markets.

2.2 What creators struggle with

- Attention and views do not turn into income by themselves; the path from posting to brand, commerce, service and IP income is unclear.
- Professional positioning, a portfolio and an understanding of pricing and rights are hard to build.
- There are few ways to reach opportunities without personal connections or lucky offers.
- Without fair terms and a verified track record, one opportunity rarely leads to the next.

2.3 How Zetaverse approaches it

Zetaverse is not a creator course or a follower marketplace. It is a Creator Operating System that turns creator potential into measurable, repeatable supply that brands can actually use. It gives brands reliable creator infrastructure and gives creators a realistic path to monetization, by standardizing the steps in between.

Step	What happens
Train	Positioning and skills
Filter	Brand fit, reliability, safety
Package	Profile, samples, rights
Deploy	Brand campaigns and commerce
Report	Results, metrics, track record

Through the proposed partnership with the Zetaverse operator, the NVEX Foundation is designing how to connect this flow to BHCT rewards for reviewed participation, service use, payments and fan

participation.

3. Zetaverse ecosystem

Zetaverse is a creator–brand campaign platform run by a separate operator and operating in Malaysia. Its tagline is "Creators today. A brighter tomorrow." The NVEX Foundation is pursuing a BHCT integration partnership with the Zetaverse operator.

3.1 Proposed partnership

The Zetaverse operator handles creator recruitment and development, brand campaign operations and the review process. The NVEX Foundation handles BHCT and the token management, payout tools and disclosures on the NVEX website. The two sides are designing how to connect reviewed campaign results to BHCT rewards, followed by service use, payments and fan participation.

The specific partnership scope and contractual terms will be published once confirmed, along with the operator's legal entity information and the responsibilities, funding and procedures for campaign settlement and BHCT payouts.

3.2 Participants and roles

Participant	Role	BHCT touchpoint
Creators	Join programs, review terms, deliver and publish content, submit results	Rewards for reviewed campaign and event work (in preparation)
Brands	Set goals, budgets and deliverables; agree terms; review content and results	Campaign payments and service use (in design)
Zetaverse operator	Recruit, develop and match creators; run campaigns; manage delivery and performance review	Agree reviewed results and token integration conditions with NVEX
NVEX Foundation	Manage BHCT treasury and permissions, the NVEX website, payout records and disclosures	Operate payout tools and pursue the BHCT integration partnership
Fans · holders	Engage with creator content and communities	Membership and fan participation (in design)
Production · service partners	Production, editing, localization or facility support within an agreed scope	Agree available services, costs, receipt of payment and refund responsibilities with the operator

Four pillars

Pillar	What it means
People	Creators growing their audience
Content	Consistent, authentic content
Community	Real conversations with fellow creators
Opportunities	First breaks, brand collaborations and monetisation

The creator journey

1. **Creatopia**: an online creator event to learn, connect, create and grow. Held on October 17, 2026 under the theme "Where Creators Create Tomorrow", it covered six topics including building an audience, first opportunities, and brand deals and monetization.
2. **Join Zetaverse**: creators join the ecosystem and continue the journey.
3. **14-Day Campaign Ready**: 14 days of content planning, filming and posting to prepare for brand campaigns.
4. **Community**: creators stay connected with their peers.
5. **Opportunities**: brand collaborations and new opportunities.

Creatopia brings creators in; the Zetaverse operator develops the community and connects it to campaign opportunities.

3.3 Campaign flow

The Zetaverse operator manages campaign work between brands and creators. The flow below shows where BHCT integration is being designed. Reviewing campaign delivery and results is a separate process from verifying a blockchain payout.

Step	Responsible parties	Output
Brief	Brand	Request covering goals, market, budget, deliverables, schedule, rights and usage scope
Assessment · matching	Zetaverse operator, creators	Candidates and proposals based on readiness, profiles, samples and performance history
Agree terms	Brand, Zetaverse operator, creators	Campaign contract setting delivery, revisions, review, rights and settlement terms
Produce · deliver	Creators	Content and delivery materials meeting the brief
Review · publish	Brand, Zetaverse operator, creators	Approval and revision records, and agreed posts
Confirm results	Zetaverse operator, brand, creators	Reports and review records for agreed metrics such as posts, reach, engagement and conversion
Settlement · reward integration	Settlement and payout parties to be set by contract and policy; NVEX token administrators	Campaign settlement records and, where BHCT payout conditions are met, payout records and transaction hashes

BHCT rewards are being prepared to follow reviewed results, with eligibility, amounts, review criteria, payout responsibility and funding sources set first. Transfer records checked by the NVEX website show whether BHCT was sent to the specified wallet; they do not replace the review of content quality or campaign performance.

Contractual compensation and optional additional rewards

Creator compensation under campaign contracts follows the agreed currency, amount, delivery and settlement terms. BHCT is proposed as an optional additional reward with a separate approved budget and participation consent. The model does not arbitrarily replace contractual compensation with tokens or make general campaign opportunities conditional on spending BHCT. Roles are separated between brand briefs and compensation, operator recruitment and review, creator execution and service choices, NVEX token management and reconciliation, and production or service partners' delivery.

3.4 Business model

Zetaverse's business model prepares creator supply through training, builds execution history through custom brand deals and commerce, and aims to turn that into repeat briefs. Production and IP collaboration are then expanded selectively around creators proven by results.

Operating layers and service deliverables

The Zetaverse operator's work is organized into six layers, with materials to pass from each step to the next. Actual feature availability will be described in operating updates.

Operating layer	Core work	Service deliverables
Creator database	Organize information by niche, audience, platform, region, readiness and history	Profiles within the agreed disclosure scope, portfolios and filtered candidate lists
Readiness assessment	Check evidence of brief execution and constraints rather than follower counts	Findings by assessment item, development tasks and notes on campaign fit
Creator development	Improve profiles, content, monetization, rights literacy and reliability	Updated profiles and samples, campaign-readiness checklists and completion records
CRM · automation	Track leads, sign-up, onboarding, activation and opportunities	Consent and progress records, follow-up tasks, conversion and drop-off reports
Campaign engine	Manage brief, matching, proposal, contract, delivery, approval and report	Agreed briefs and contracts, delivery, revision and approval records, reports and settlement materials
Performance history	Record deadlines, revisions, quality and campaign results on a consistent basis	Creator- and brief-level performance records, reasons for redeployment and improvements for the next campaign

Readiness assessment and matching criteria

The proposed assessment records evidence, development needs and fit for each brief. It does not set follower count as the sole pass condition or prescribe one score or weighting for every campaign.

Assessment item	Evidence to review	Use in matching and development
Positioning · audience	Topics, languages, region, platforms and available audience information	Fit with the brief's product, market and content objectives
Content samples	Original samples, format, quality, clarity and required production skills	Ability to meet deliverable and quality requirements, and any production support needed
Response · deadlines · revisions	Responses to requests, schedule confirmation, submission and revision history	Availability and reliability through communication and delivery
Brand safety	Advertising disclosures, restricted claims and categories, conflicts and brief compliance	Fit with the brand's stated participation and publishing conditions
Rights literacy	Permission for content, music, likeness and brand assets, and the scope that can be offered	Rights needed for reuse, paid media, territories and duration
Reporting	Ability to organize post links, source platform metrics and measurement periods	Ability to deliver the agreed report

The operator would distinguish verified items, development needs and reasons to defer a creator for a particular brief, then confirm participation terms with the creator. After delivery and review, the operator would compare the assessment with actual execution and update profiles, development tasks and future candidate selection.

Holding or buying BHCT, or paying for an optional service, is not a condition of general matching, campaign participation, basic readiness assessment or selection. Paid services do not guarantee brand deals, preferential selection or higher trust scores.

Brand deal types

Brand deals are not one fixed package for every country. Each campaign is designed around the commercial problem, creator mix, deliverables, production scope, rights, media use, region, duration and performance goals.

Type	Intended value
Creator · UGC campaigns	Product stories, demos, user experience, launch content, awareness
Affiliate · live commerce	Trackable sales, live hosts, referral links and codes
Brand market entry	Localization, product seeding, category-specific creator activation
Branded entertainment	Short-form series, creator-led formats, production collaboration
Long-term · IP partnerships	Ambassadors, creator brands, licensing, production participation

Contract terms, rights and revenue allocation for each campaign are set in that campaign's agreements. No distribution of this business revenue or IP rights to BHCT holders is promised.

Monetization paths and commercial terms

The direction is to define the brand's problem and the work to be delivered first, then agree compensation and settlement for that scope. Training prepares creator supply; registration or training participation is not treated as brand revenue.

Monetization path	Work whose compensation would be agreed	Items to separate before contracting
Campaign · production operations	Creator selection and coordination, UGC and branded production, delivery and reporting	Creator compensation, production and operating fees, media spend and reimbursable costs
Affiliate · live commerce	Sales referrals, live hosting, referral links and codes	Attribution period, orders, cancellations and returns, and settlement evidence
Market entry · localization services	Local creator sourcing, language and content localization, launch campaigns	Scope by market, language and period, and terms for additional work
Selected IP · long-term collaboration	Licensing, production or management participation, products and fan experiences	Contractual rights, contributions, costs, revenue allocation and treatment on termination

Terms to agree	Items in the proposed operating model
Scope · schedule	Objectives, deliverables, production and posting dates, contacts and approval sequence
Review · revisions	Acceptance criteria, revision scope, additional requests and scope changes
Rights · usage	Ownership versus permission, media, territories, duration, editing, paid use and exclusivity
Compensation · settlement	Compensation by task, costs, taxes and fees, payout conditions and settlement records
Performance-based terms	Metrics, sources and periods, cancellations, returns and invalid traffic
Interruption · disputes	Cancellation before or after delivery, completed work, rejection, reconsideration, refunds and dispute submission
Data · disclosure	Personal and commercial information exchange, retention, access and consent to publish case studies

How campaign economics would be assessed

The proposal is to separate business compensation from creator payments, media spend and expenses administered on behalf of others, and to record direct production and operating costs and time spent for each campaign. The whole campaign budget would not be presented as platform revenue or profit.

Operating decisions would consider business compensation after separating pass-through payments, less direct costs borne by the business from that compensation, alongside time spent. Direct costs considered would include contractually borne creator compensation, production, localization, operations and payment costs, without subtracting already separated pass-through payments twice. Detailed categories would follow the contracts and accounting treatment, with revisions, non-payment, cancellation, creator replacement and cross-border work also assessed.

Repeat brand demand, reductions in sourcing and review time for similar campaigns, and the ability to cover direct costs would inform expansion. BHCT reward budgets would be recorded separately from business payments and direct costs so token transfers are not confused with cash revenue or profit.

Asia corridor

Zetaverse is designed as an operating bridge between the strengths of three regions. The plan connects creator sourcing, casting, localization, management, campaign operations and reporting for overseas partners entering Southeast Asia.

Region	Strengths	Role in the Zetaverse business model
Korea	Entertainment, production, K-beauty and lifestyle brands, IP creation	Access to content and talent, production partnerships, Korean brands entering Southeast Asia
Southeast Asia	Large creator pool, growing social commerce, localization demand	Creator recruiting, market execution, campaign operations, regional expansion
China	Live commerce, AI and content technology, operating systems	Training systems, AI workflows, virtual talent, live-commerce operations

Zetaverse runs the platform in Malaysia and is conducting an early pilot of the cross-border campaign operating model in the Philippines. The Philippines is the first proof market for that model. The regional roles describe strategic directions and do not indicate signed partnerships with particular companies or institutions.

The pilot model starts with a brief from a Korean brand or content partner. The Zetaverse operator selects and prepares Southeast Asian creators and manages localization and delivery. Live commerce, AI content and automation capabilities may be added where useful. Content results, conversion, creator performance, operating cost and repeat brand demand are the measures to assess when results are published.

3.5 Performance measurement and matching feedback

The proposed approach agrees objectives, calculation rules, measurement periods and source data at campaign start, then records results on the same basis. These definitions are proposals, not achieved results or confirmed numerical targets.

Metric	Definition and interpretation	Evidence
Lead → sign-up · onboarding conversion	Share of the same source and period completing the next step, with the denominator stated for each step	Lead sources and sign-up and onboarding records with duplicates identified
Readiness · campaign placement	Distinguish assessed readiness from actual acceptance and placement	Item-level assessments, candidate proposals, acceptance and placement records
On-time delivery · completion	Count delivery by the agreed date separately from final acceptance	Delivery times, agreed schedule changes and approval records
Revisions · rejections	Reasons for requested revisions or rejection, and review outcomes by submission	Brief versions, review comments, revisions and decisions
Impressions · views · reach	Distinguish platform impressions and views from unique reach; do not assume unduplicated reach across platforms	Platform exports or source materials with a reference time
Engagement	Agreed actions such as likes, comments and shares; identify whether any rate uses views, impressions or reach as its denominator	Platform metrics and measurement periods
Clicks · conversions	Actions or orders linked to tracked links or codes; agree attribution period and cancellation, return and duplicate handling first	Links and codes, analytics and order records, settlement data
Repeat brand demand	Share of eligible brands with a follow-up brief or contract, distinguishing inquiries from signed work	Earlier campaigns, follow-up briefs and contracts
Operating economics	Workload, direct costs and settlement outcomes by campaign, and changes across repeat work	Work and cost records, contracts and settlement materials

Public scale metrics would also carry activity definitions, population and period, duplicate handling and supporting sources. Event attendance, program participation, verified readiness and paid campaign delivery would be separate measures so their meaning is clear.

The operator would retain source locations and verification times in reports and record reasons for reviewing missing or conflicting data. Results would be compared with the next brief's category, market, format, schedule and rights requirements to improve candidate selection, readiness assessment and development tasks. Public case studies would include the agreed scope of objectives, period, work, measurements and limitations with disclosure consent.

Comparable operating models

Reference model	Area described in official materials	Application to Zetaverse's proposed model
AnyMind · AnyTag / AnyCreator	Brand selection, content checks and reporting, and creator campaign participation	Connect brand and creator workflows and retain progress and result records
Partipost	Briefs, profile and past-content review, approval, revision and rejection before publishing, and metric tracking	Set participation and review criteria in advance and connect results with revision reasons
Gushcloud	Creator brand deals, production, IP development, commerce and overseas opportunities	Select proven talent from campaign history and expand through individual production and rights agreements

These references concern operating structures described by the services themselves. They do not indicate partnerships or investments involving NVEX or Zetaverse, or equivalent features or results. Official materials are linked in References (https://nvex.attackgo.com/en/whitepaper/references).

Distinguishing token examples

Token example	Connection described in official materials	Distinction from this proposal
BAT · Brave Rewards / Creators	BAT rewards for ad participation and contributions to creators	A reference for connecting attention and support, not evidence of BHCT demand, funding or profitability
Contentos · COS.TV	Earlier content-participation and COS reward design; COS.TV and Channel VIP wind-down announced for December 1, 2026, with full shutdown December 14	A reference for historical token use and service-exit handling, not a currently sustainable success model for this proposal

The shutdown notice says Contentos Mainnet, COS Swap and the mainnet wallet will continue. AnyMind, Partipost and Gushcloud are references for business operations; Contentos and BAT concern particular token connections. None establishes a partnership, investment relationship or the necessity of BHCT.

3.6 Why Zetaverse needs BHCT

Zetaverse's bottleneck is not the number of creators but creator supply that brands can actually use. That supply is built from behaviour: finishing training, delivering on time, handling revisions and reporting results. Yet campaign contractual pay only compensates the deliverable; nothing separately rewards this preparation and reliability.

BHCT is the incentive layer that rewards exactly this stretch. BHCT is paid for verified contributions at each of the operating system's five steps, and the BHCT received is spent again on preparation services in the Zetaverse ecosystem. Rewards don't leak out of the ecosystem; they are reinvested in the creator's next round of preparation.

Operating step	Problem Zetaverse is solving	What BHCT does
Train	More creators need to finish the course and become campaign-ready	Completion rewards for the 14-day program; access to advanced training
Filter	Readiness must be judged on evidence, not follower counts	Rewards for reaching readiness levels; holdings are never part of the assessment
Package	Profiles, samples and rights take money and help to prepare	Spending earned BHCT on Creator Profile Clinic and Production Support
Deploy	Brands need supply that delivers on time, handles revisions and stays brand-safe	Bonuses for on-time delivery and passing review; performance bonuses designated by repeat brands
Report	Performance history must build up for the next match to be accurate	Report-submission bonuses; payout records on-chain back the performance history

Brands have a reason too. The business materials name a repeat booking as the simplest proof. A repeat brand can designate BHCT performance bonuses for creators in its next campaign, attaching extra rewards to the criteria it cares about without handling tokens itself. In the Asian corridor, where Korean brands, Southeast Asian creators and Chinese technology partners work together, these rewards must move across countries and companies under the same rules, which suits a shared token better than one company's points.

In Stage 2, BHCT earned in Stage 1 carries into memberships and fan experiences with verified creators, and in Stage 3 into regional hub facilities. It is one asset that carries early contributors' rewards into the next stages of the ecosystem. The full distribution, use and recovery design is in Token economy (https://nvex.attackgo.com/en/whitepaper/token-economy).

3.7 BHCT integration touchpoints

NVEX and the Zetaverse operator are designing the touchpoints below around the proposed partnership scope and terms of use. Token issuance and available website payout tools do not by themselves mean that every use has launched on Zetaverse.

Touchpoint	Work to be connected	Current status
Rewards after review	Connect the operator's campaign and event review results to NVEX's BHCT payout records	In preparation with payout tools in place. First-payout conditions, responsibility and funding to be announced in advance
Brand-designated performance bonus	A repeat brand designates extra BHCT rewards against performance criteria in its next campaign; the foundation verifies the conditions and pays	Proposed model · Stage 1 pilot candidate
Optional service use	Catalog and delivery terms for proposed Creator Profile Clinic and Production Support, separate from basic assessment and matching	Proposed model · not launched
Campaign payments	Process and settlement for brands paying part or all of a campaign fee in BHCT	In design; subject to Stage 2 regulatory and payment review
Membership · fan participation	Access to memberships, fan content and experiences from verified creators	In design; rights and access conditions to be reviewed in Stage 2

3.8 Current status and planned disclosures

Operating	Malaysia
Countries of partner companies	20
Active creators	2,000

Table 1. Zetaverse scale · As of Nov 2026

Component	Responsible party	Status
Zetaverse platform	Zetaverse operator	Live (Malaysia)
Creatopia	Zetaverse operator	Held October 17, 2026
14-Day Campaign Ready	Zetaverse operator	In progress
Early Philippines pilot	Zetaverse operator	In progress
BHCT	NVEX Foundation	Issued · rewards in preparation
NVEX website · My BHCT	NVEX Foundation	Balance lookup, account wallet linking and reward history live
Disclosure board · Supply API	NVEX Foundation	Supply, payout and permission disclosures and supply data live
BHCT integration partnership	NVEX Foundation, Zetaverse operator	Being pursued; confirmed scope and terms to be published

The following will be reflected in disclosures and new whitepaper versions as they are verified or confirmed:

- The Zetaverse operator's legal entity information, and scope and progress of the BHCT integration partnership
- Parties, funding and conditions for campaign settlement and BHCT payouts; exchange of review results and dispute handling
- Participant counts for Creatopia and the 14-day program, and Philippines pilot results
- Features, launch conditions, rights and access scope for each use

Brand collaboration inquiries and creator pre-registration are accepted on the Join Zetaverse (https://nvex.attackgo.com/en/join) page.

4. Token economy

The BHCT token economy is designed around three flows. **Distribute**: tokens leave a fixed supply only for verified contributions. **Use**: they are spent on services, access and campaign features in the Zetaverse ecosystem. **Recover and recycle**: spent tokens return to the ecosystem reward pool and fund the next contribution rewards. Because there is no minting, rewards are never expanded by creating new tokens; the same tokens are used again inside the ecosystem.

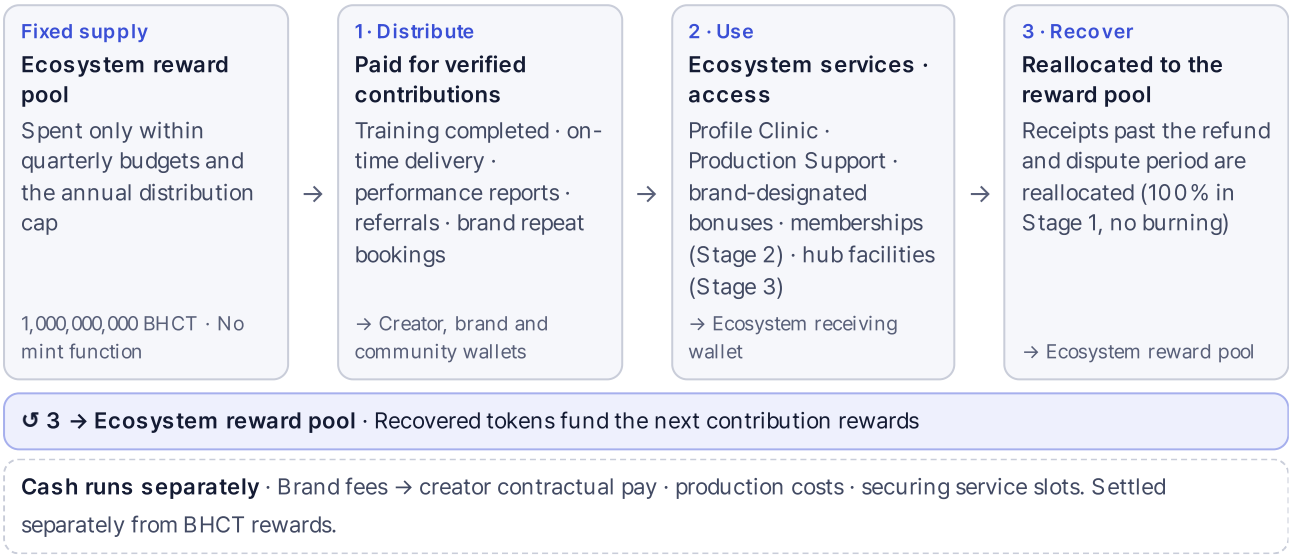

Figure 1. BHCT token circulation (design)

> This chapter is the token economy design that the NVEX Foundation is agreeing with the Zetaverse operator. What works today is the fixed-supply treasury, the payout tools (member wallet linking, payout records, on-chain transfer checks), disclosures and the supply API. Distribution, use and recovery open as limited pilots once the start conditions in "Rollout by stage" at the end of this chapter are met, and each start is disclosed. The ratios, caps and amounts in this chapter are proposed values and will be disclosed once confirmed.

4.1 Why BHCT is needed

Zetaverse is not a service that ends inside one company. Korean brands issue briefs, Southeast Asian creators deliver, a separate operator reviews, and production, editing and localization partners support the work: many parties in many countries. Rewarding contributions in that structure, and letting those rewards be used again inside the ecosystem, requires five things. BHCT is designed to provide them.

What is needed	Limits of cash or internal points alone	BHCT's role
Rewards for the behaviour that creates supply quality	Contractual pay compensates the deliverable only; there is no separate mechanism for the behaviour that makes "creators brands can actually use", such as finishing training, delivering on time and reporting.	An incentive layer that pays verified contributions at each operating step, run from a budget separate from contractual pay
A unit many parties can share	Internal points only work inside the issuing company and are hard for partners in other companies and countries to accept or settle. Small cross-border cash bonuses carry high fees and delays.	A common unit that the operator, service partners, brands and creators exchange under the same rules
Rewards creators own	Balances inside a platform can be changed or expired by the operator.	Rewards land in the creator's own wallet and the creator decides whether to spend them. Unspent BHCT has no expiry.
A verifiable performance record	Internal records can't be checked from outside.	Every payout leaves a transaction hash anyone can check on the block explorer; linked to campaign review records, it backs a verified performance history.
A disciplined incentive budget	Points can be issued at will, which undermines budgets and trust.	A fixed supply with no mint function, a disclosed treasury and monthly payout disclosures let anyone check the budget.

How cash and BHCT divide the work

BHCT does not replace cash; it does what cash does poorly. Contractual payments that need a stable value stay in cash, while contribution rewards, ecosystem use and access are designed around BHCT.

Layer	Instrument	What it covers
Contract · cost layer	Cash (compliant stablecoin payment rails reviewed from Stage 2)	Brand campaign fees, creator contractual pay, production and operating costs, securing service slots
Incentive · use layer	BHCT	Verified contribution rewards, brand-designated performance bonuses, ecosystem services, membership and fan access

A stablecoin can serve as a means of payment, but it is not a unit that carries rules such as distribution caps, recovery and reallocation, or ecosystem access. It is therefore reviewed separately as a Stage 2 payment-rail candidate, while incentives and use stay with BHCT.

4.2 Flows by participant

Participant	How they receive BHCT (distribution)	Where they use it (use)
Creators	Completing the 14-day program, reaching readiness levels, bonuses for on-time delivery, passing review and submitting reports, bonuses for meeting brand goals, referring qualified creators	Creator Profile Clinic, Production Support (editing, subtitles, localization, studio), advanced training, fan-membership tools from Stage 2 and hub facility booking in Stage 3
Brands	A "BHCT performance bonus allocation" earned when a paid campaign is settled and the brand books again	Designating extra performance bonuses for creators in the next campaign. Brands don't need to hold tokens; the foundation pays creators once the conditions are verified.
Fans · community (Stage 2)	Community missions: joining events, referring creators, giving campaign feedback	Creator memberships, fan-only content and experiences, merchandise and direct-to-fan benefits
Service partners	Don't receive BHCT; they are paid the agreed cash price for secured service slots	Not applicable. Token receipt and settlement burdens are not passed to partners.
Zetaverse operator	Not a distribution recipient; provides campaign and program review records	Not applicable
NVEX Foundation	Manages the reward pool and the ecosystem receiving wallet, and records and discloses distribution and recovery	Reallocates recovered tokens to the reward pool after approval

BHCT holdings are never factored into campaign selection, readiness assessment or trust scores. Selection depends only on readiness and performance, so the token does not dilute supply quality.

4.3 Distribution: only for verified contributions

Signing up, linking a wallet or holding tokens earns nothing. There are no trading rewards, holding interest or staking returns. Distribution goes only to contributions linked to the operator's review records, within budgets approved for each period.

Contribution	Basis for payout	Payout method (proposed)
Training completed	Completion records, such as the 14-day campaign-ready program	A fixed amount announced per program
Readiness reached	Records of passing a readiness assessment level	A fixed amount per level, once per level
Campaign delivery	Review records for on-time delivery, meeting revision criteria and submitting reports	Amounts per criterion within the campaign budget
Performance achieved	Result reports on metrics agreed with the brand	Within a per-campaign cap, including brand-designated bonuses
Referral	The referred creator reaches readiness, or the referred brand settles its first paid campaign	Once, when activation is confirmed
Brand repeat booking	Settlement record of a paid campaign	A performance-bonus allocation to designate in the next campaign
Community missions (Stage 2)	Event and mission participation records	A cap per mission

- **Period budgets**: a distribution budget is set and disclosed each quarter, and payouts stay within it. Unused budget remains in the reward pool.
- **Annual distribution cap (proposed)**: a year's distribution does not exceed 10% of the reward pool balance at the start of the year. Because the cap tracks the pool balance, distribution tapers gradually each year, and reallocated tokens extend it further.
- **Per-person and per-campaign caps**: caps apply per account, wallet and campaign; duplicate accounts and self-dealing put payouts on hold for review.

4.4 Use: ecosystem services and access

Uses come from the actual work of the Zetaverse business. Each service opens only after its fixed BHCT price, capacity, deadlines, provider and cancellation and refund terms are published in a catalog.

Stage	Use	Business link
Stage 1	Creator Profile Clinic, Production Support, advanced training (live commerce, AI content and more)	Train → Package: creators reinvest rewards in preparing for the next campaign.
Stage 1	Brand-designated performance bonuses	Deploy → Report: repeat brands set performance criteria and reward creators further.
Stage 2	Creator memberships, fan-only content and experiences, merchandise and direct-to-fan benefits	IP · fan economy: repeat engagement around verified creators.
Stage 2	Part of campaign payments through compliant payment rails	Cross-border commerce: decided after KYC/AML and country-by-country regulatory review.
Stage 3	Booking studios, editing rooms and live-commerce equipment at creator hubs; programs with education partners	Regional hubs: facilities and training connect through the same token.

4.5 Recovery and recycling

BHCT spent on services and access is received at the NVEX Foundation's **ecosystem receiving wallet**, published in the catalog. Service partners receive the cash price of pre-secured slots instead of tokens, so spent tokens return straight to the ecosystem rather than passing through partners to the market.

1. BHCT paid for an order arrives at the ecosystem receiving wallet and is linked to the order and delivery record.
2. That amount is held until the refund and dispute period ends. Refunds return the same BHCT amount.
3. Receipts whose period has ended are reallocated to the reward pool after monthly reconciliation and approval. The Stage 1 proposal is **100% reallocation of recovered tokens**.
4. Reallocated tokens pass through the next quarterly budget and are distributed as new contribution rewards.

The ecosystem receiving wallet and the reward pool wallet are registered as disclosed wallets. Spent tokens therefore leave circulating supply and re-enter it when distributed again, so circulating supply shows exactly what has been distributed and not yet returned to the ecosystem.

The contract supports burning, but in Stage 1 recovered tokens are reused as reward funding rather than burned, to keep rewards going longer within a fixed supply. Whether to burn a share from Stage 2 onwards will be decided and disclosed after reviewing circulation metrics. There is no policy of buying tokens with business revenue to burn them.

4.6 Sustainability: token budget and cash budget

Budget	Source	Spent on
Token budget	The ecosystem reward pool (an allocation within the fixed supply) plus reallocated recoveries	Contribution rewards, brand-designated bonuses
Cash budget	An ecosystem service budget to be agreed with the operator from Zetaverse brand-deal revenue, the foundation's operating budget, in-kind contributions from partners	Securing service slots, partner fees, gas and refund handling

Services paid in BHCT open only within slots already secured with the cash budget, because receiving tokens does not create cash for editors or studios. If the cash budget isn't secured, distribution is not increased, and a rising token price is never assumed as a funding source.

Balancing rules

Signal	Meaning	Adjustment
Low recovery rate (distributed tokens aren't being used)	Too few uses, or uses that aren't worth it	Reduce next quarter's distribution and strengthen the catalog
Capacity full · waiting lists	Not enough slots secured with cash	Secure slots first instead of increasing distribution
Bonuses paid but delivery, revision and reporting metrics don't improve	Reward criteria aren't changing behaviour	Redesign contribution criteria and amounts
Payouts concentrated in certain accounts or regions	Possible duplicate accounts or abuse	Hold and review payouts, apply per-person caps

Circulation metrics published monthly

Alongside payout disclosures, the plan is to publish distributed amounts, amounts used, amounts recovered and reallocated, amounts held (refunds and disputes), the reward pool balance, the recovery rate (recovered ÷ distributed), completed service uses and the repeat-use rate. Internal recovery and reallocation are never counted as external demand or new purchases.

4.7 Stage 1 pilot figures

These are the figures applied to the first limited pilot. The tables below are linked to the admin settings and show the same values on the token page (https://nvex.attackgo.com/en/token#token-economy), with their status (proposed or confirmed) and as-of date beneath each table. When the figures change each quarter, these values are updated and disclosed instead of publishing a new whitepaper version. The figures follow three principles.

- **Base unit**: one Creator Profile Clinic session and the reward for finishing the 14-day program are set to the same amount, so the reward for completing training pays for a packaging service straight away.
- **Distribution matched to capacity**: the quarterly distribution budget, excluding the reserve, is set close to the total quarterly capacity of the service catalog, so every distributed token has somewhere to be used.
- **Start small**: the quarterly budget starts far below the quarterly share of the annual distribution cap and is increased only after circulation metrics are reviewed.

The headcounts and campaign counts in the tables are planning caps for the budget, not forecasts or achieved figures.

Reward amounts by contribution

Contribution	Amount (BHCT)	Conditions · caps
14-day campaign-ready program completed	1,000	Completion record verified, once per person
Readiness level 1: basic profile and samples verified	500	Once per person
Readiness level 2: ready for campaign placement	1,000	Once per person
Campaign delivery: on time	500	Per campaign
Campaign delivery: revision criteria met	300	Approved within the agreed number of revisions, per campaign
Campaign delivery: report submitted	200	Result report including platform source data, per campaign
Performance achieved	Up to 1,000	Metrics agreed with the brand achieved, per campaign
Creator referral	300	When the referred creator reaches readiness level 2; up to 10 per referrer per quarter
Brand referral	2,000	When the referred brand's first paid campaign is settled; once per brand
Brand repeat-booking bonus allocation	Up to 5,000	For each settled paid campaign, a limit to designate in the next campaign (up to 500 per participating creator). Allocations unused by the next campaign's settlement stay in the reward pool

Table 2. Reward amounts by contribution · Proposed · Stage 1 first-quarter pilot · as of November 5, 2026 · Per-person cap 8,000 BHCT per quarter

The per-person quarterly cap is shown below the table. Payouts are batched monthly, on the same cycle as the monthly payout disclosure, and the foundation pays payout gas.

Service catalog prices and capacity

Service	Unit	Price (BHCT)	Quarterly capacity	Capacity total (BHCT)
Creator Profile Clinic	60-minute session and one profile/portfolio revision proposal	1,000	120 sessions	120,000
Production Support · short-form editing	One video up to 60 seconds, one revision	1,500	120 videos	180,000
Production Support · subtitles · localization	One video, one language	800	150 videos	120,000
Production Support · studio	2 hours with basic equipment (available regions only)	2,000	40 sessions	80,000
Advanced training	One seat at a live-commerce or AI-content workshop	1,200	160 seats (4 × 40)	192,000
Total				**692,000**

Table 3. Service catalog prices and capacity · Proposed · Stage 1 first-quarter pilot · as of November 5, 2026

- Prices are set in BHCT amounts and are not tied to a market price. Because rewards and prices use the same unit, the relationship "rewards pay for services" holds whichever way a price moves, and the foundation's cash exposure is fixed at the capacity it has secured.
- Prices are fixed for each quarter; changes are announced in advance and apply to new orders from the next quarter.
- Ordered services must be used within 60 days, and the 14 days after delivery are the refund and dispute period. After that, receipts are reallocated to the reward pool monthly.
- Capacity opens only for slots secured with the cash budget; the cash cost per slot is set by the providing partner's quote.
- Sending a service payment requires BNB for gas, so the proposal is a one-time BNB top-up per person, enough for a few transfers, alongside the first reward (from the foundation's cash budget).

Quarterly distribution budget

Item	Planning cap	Amount (BHCT)
14-day program completed	200 people	200,000
Readiness levels 1 · 2	200 at level 1, 100 at level 2	200,000
Campaign delivery bonuses	100 campaigns × up to 1,000	100,000
Performance achieved	100 campaigns × up to 1,000	100,000
Referrals	100 creators, 5 brands	40,000
Brand repeat-booking bonus allocations	10 × up to 5,000	50,000
Subtotal		**690,000**
Reserve (reprocessing and upheld disputes)		60,000
Quarterly budget		**750,000**

Table 4. Quarterly distribution budget · Proposed · Stage 1 first-quarter pilot · as of November 5, 2026 · Distribution subtotal 690,000 BHCT · catalog capacity total 692,000 BHCT

The distribution subtotal and the catalog's total capacity are shown together beneath the table, so anyone can check that every distributed token has somewhere to be used.

Adjustment criteria for the next quarter

Metric	Threshold (proposed)	Adjustment
Quarterly recovery rate	Below 30%	Cut the next quarter's distribution budget by 25% and strengthen the catalog
Capacity utilization	90% or more	Secure slots first, then raise capacity and the distribution budget together
Budget utilization	Below 50%	Keep the remainder in the reward pool and don't raise the next quarter's budget
Hold · rejection rate	10% or more	Review payout conditions and review criteria before approving the next quarter's budget

4.8 Circulation example

This example applies the Stage 1 figures in effect when v1.5 was published to illustrate the structure. Actual payouts follow the current figures in the tables above and review results.

Step	What happens	Creator wallet	Reward pool · receiving wallet
1	A creator in the Philippines finishes the 14-day program and receives a completion reward	+1,000	Reward pool −1,000
2	Uses one Creator Profile Clinic session	−1,000	Receiving wallet +1,000
3	Reaches readiness levels 1 and 2	+1,500	Reward pool −1,500
4	Selected for a Korean brand's campaign; contractual pay is in cash, plus on-time delivery, revision and report bonuses	+1,000	Reward pool −1,000
5	Meets the repeat brand's performance criteria and receives the brand-designated bonus	+500	Reward pool −500
6	Orders one short-form edit through Production Support for the next campaign	−1,500	Receiving wallet +1,500
7	Receipts past the refund period are reallocated to the reward pool	—	Receiving wallet −2,500, reward pool +2,500

4,000 left the reward pool and 2,500 came back; the creator holds 1,500. Cash contractual pay and service costs are settled separately from this table.

4.9 Rollout by stage

Stage	Distribution	Use	Recovery	Start conditions
Stage 1	Training, readiness, campaign delivery and performance, referrals, brand repeat bookings	Service catalog, brand-designated bonuses	100% of receipts reallocated	Integration partnership confirmed, allocation plan and first quarterly budget disclosed, catalog and cash budget secured
Stage 2	+ Community missions	+ Memberships and fan experiences, payment-rail review	Review whether to burn a share	Stage 1 circulation metrics and business gate confirmed, rights and regulatory review
Stage 3	+ Hub and education programs	+ Hub facility booking	Regional operating rules	Hub operators and regional conditions confirmed

Uses in each stage open as their start conditions are met; the status table in BHCT utility (https://nvex.attackgo.com/en/whitepaper/utility) is the reference for actual status.

4.10 What we don't do

- No interest, dividends, profit sharing or staking rewards for holding BHCT.
- No buying tokens with business revenue and no activity to support the price.
- No guarantee of cash redemption or a fixed conversion value.
- Holding or buying BHCT is never a condition for joining or being selected for campaigns.

5. BHCT utility

BHCT's uses are designed around practical applications under the proposed integration partnership with the Zetaverse operator. Each use carries a status, and only working features are described as "Live". The statuses below are the same values shown elsewhere on this site.

Use	Description	Status
Campaign payments	How brands pay for campaigns. Where it stands: BHCT payment for part or all of a campaign is being designed with the operator. Eligible campaigns, settlement and cancellation terms, and responsibilities will be announced once confirmed. Stage 2 includes payment and regulatory review.	In design
Creator rewards	Rewards for campaigns with confirmed results. Where it stands: Campaigns may offer optional BHCT rewards separately from contractual fees. Payout tools are ready; eligibility, capped budgets, funding, approval and timing require agreement and advance notice before the first payout.	Preparing
Service use	Proposed partner services such as profile clinics and production support. Where it stands: Proposed pilot products: profile/portfolio clinics and production support. Launch requires an agreed catalog, service capacity, funded costs, token quotes and refund terms. BHCT holdings will not determine basic campaign eligibility or matching.	In design
Memberships · Fan access	Creator IP, memberships and fan access. Where it stands: Stage 2 considers BHCT access to proven creators' memberships, fan content and experiences. Access and usage terms depend on rights agreements and relevant review. Holding BHCT itself does not confer IP ownership.	In design

Table 5. Uses and status · as of November 5, 2026 at 1:56 AM UTC

5.1 What the statuses mean

Status	Meaning
Live	Working, and available to anyone who meets the conditions
Pilot	Running first with selected participants under set conditions
Preparing	Preparing for its first run. Tool readiness and operating conditions are described separately in the progress notes.
In design	Audience, conditions and process are being designed
Unconfirmed	Whether to introduce it is under review

5.2 Design direction and progress by use

Creator rewards

We are preparing to connect campaign and event results reviewed by the Zetaverse operator to BHCT rewards. When paid, tokens are sent from the treasury to the wallet the creator linked to their NVEX account. Wallet linking, payout records, on-chain receipt checks and disclosure tools are in place. Before the first payout, partnership scope and campaign-specific eligibility, amounts, review criteria, payout responsibility and funding will be set and announced. A pilot being in progress does not by itself start payouts or entitle every participant to a reward.

Campaign payments

We are designing with the Zetaverse operator a way for brands to pay part or all of a campaign fee in BHCT. Eligible campaigns, payment receipt and settlement responsibilities, and terms of use will be announced once confirmed. BHCT payments will be reviewed in Stage 2 together with payment rails that follow KYC/AML and each country's payment and virtual-asset rules.

Service use

Creator Profile Clinic and Production Support are proposed initial BHCT service candidates, separate from basic readiness assessment and general matching. They are optional additional support; available work, capacity, costs and responsibilities would be agreed with the operator and service partners. This is separate from the NVEX website's existing balance lookup and wallet-linking features.

Membership · fan participation

In Stage 2, we will design with the operator how BHCT could provide access to memberships and fan-only content and experiences from creators proven by results. Scope and access conditions will depend on individual rights agreements and legal and commercial review. Holding BHCT does not by itself confer IP ownership or rights to business revenue.

5.3 Proposed initial services and catalog

Service candidate	Proposed deliverable	Scope boundaries
Creator Profile Clinic	Profile and portfolio feedback and revision recommendations for commercial packaging	Advice and feedback separate from basic assessment and selection; sessions, review scope and output format set in the catalog
Production Support	Editing, subtitles, localization, studio or equipment support where supply can be agreed	Offer only secured services by scope and provider, rather than promising all forms of support as a bundle

Proposed prices, capacity and the first quarterly budget are in "Stage 1 pilot figures" in Token economy (https://nvex.attackgo.com/en/whitepaper/token-economy). The proposed catalog would publish the following before launch. Fan access is not an initial service; it would be considered separately after Stage 2 rights agreements and delivery conditions are in place.

Catalog field	Conditions to disclose
Service · output	Available tasks, sessions, delivery scope, inclusions, exclusions and revision terms
Capacity · schedule	Secured slots, booking window and use or delivery deadline after booking
Provider	Actual operator or partner delivering the service, support and dispute contacts, and markets
Price · payment receipt	Fixed BHCT amount, official receiving wallet, order identification and payment confirmation
Cancellation · refund	Cancellation deadlines, completed work and gas treatment, refund party and timing for non-delivery, delay or disputes

Proposed pricing · booking · refund rules

The initial proposal is to publish a fixed BHCT amount, capacity and valid booking period for each catalog item. This does not guarantee a cash-equivalent value, token price or foundation buyback. Real-time conversion payments would be deferred without a verifiable market reference. Later price changes would apply to new orders after notice, while accepted bookings retain their agreed terms.

The design covers voluntary payment for an actual service order after checking the item, provider, receiving wallet and terms. It is not an instruction to send tokens on the current website, and automated payments or escrow are not implemented. Order, receipt, delivery and refund records would be linked for reconciliation.

The proposed refund default is the same BHCT quantity. Any different treatment for completed work or network costs would be separately explained and agreed before ordering. Tokens reserved for refund obligations would not be reallocated to rewards before the refund and dispute period ends. Booking and service deadlines are distinct from tokens held in a wallet; unused BHCT itself would not be assigned an arbitrary expiry date.

5.4 Proposed creator reward operations

Reward integration starts with reviewing work against campaign-specific terms and recording the basis for payment. The following is a proposed model for NVEX and the operator to agree; amounts, schedules and final responsibilities would be announced with operating conditions.

Design item	Proposed direction
Eligibility · participation	Announce the audience, acceptance, required account and wallet, and country-specific conditions for each campaign or program
Reward calculation	Set amounts, calculation basis and caps for each campaign according to scope, agreed deliverables, review criteria and budget
Budget · funding	Agree a reward budget from existing BHCT and the party providing it, distinguishing it from business payments and creator compensation under campaign contracts
Review · approval	The operator organizes work and review records; the approval party designated by contract confirms eligibility, results and amount
Payout · settlement	Announce payout responsibility, expected timing, network cost allocation, account and wallet checks, and failed-payout handling
Holds · rejections	Define reasons and procedures for missing evidence, unmet conditions, duplicate claims, review disagreements and resubmission
Changes · cancellation	Set and announce policies for campaign interruption, scope changes, completed work and errors before or after payout

The planned workflow is participation acceptance → evidence submission → operator review → payout-condition confirmation → payout registration → on-chain confirmation → disclosure. Evidence correction and reconsideration would be recorded before transfer; errors identified after transfer would have separate verification and response records and disclosures. Contract permissions and their risks remain described in Contract and permissions (https://nvex.attackgo.com/en/whitepaper/contract).

Why reward in BHCT?

Why rewards are designed in BHCT, and how the work is divided with cash, points and stablecoins, is set out in "Why BHCT is needed" in Token economy (https://nvex.attackgo.com/en/whitepaper/token-economy). In short, contractual pay and costs stay in cash, while rewards for contributions that create supply quality, and ecosystem use, run on BHCT, a fixed-supply token many parties use under the same rules. The pilot compares total cost, processing time and reuse rate against existing methods such as cash and points on the same basis, and expands integration as far as those benefits are confirmed.

5.5 Proposed token-pilot measurement definitions

Metric	Definition to agree in advance	Evidence and limits
Service-use rate among reward recipients	Share of the cohort paid within the observation period who complete a service under the same observation rules	Link payout, order and delivery records; state dates and duplicate and cancellation handling
Repeat use	Share of completed-service users completing a later order, and the time to reuse	Separate new and repeat orders, incomplete work and refunds
Reward-linked reuse · total receipts	Distinguish BHCT received for orders reconcilable to campaign reward records from all service receipts	Publish order and campaign attribution rules; wallet balances alone do not trace the atomic provenance of particular tokens
Monthly token flows	Reward outflows, order receipts, refunds, actual returns, reallocation, reserves and closing balances	Cross-check budget ledgers, orders, transaction hashes and monthly reconciliation
Cash costs · budget duration	Service, gas and refund costs and projected depletion of available cash and token reward budgets	State obligations and budget assumptions without relying on token appreciation as funding
Cost · time versus existing methods	Compare total payout, onboarding, reconciliation, gas and support costs and time for equivalent work	State the cash or points baseline and observation period

Reward-linked service usage, total receipts, net external market demand and independent organic use are separate metrics. Internal returns and reallocation would not count as new purchases or external demand. Without data distinguishing them, the pilot would not claim to validate market demand.

5.6 Design principles

- Uses start from Zetaverse's actual campaign flow.
- Each use is explained by who earns it, where it is used and which conditions apply.
- Payment and payout features are designed on the premise of KYC/AML and country-specific regulation, and introduced after early campaign results are confirmed.
- Starting, changing or stopping a use is disclosed and reflected in a new version of this whitepaper.

5.7 What we don't do

- This website does not sell BHCT.
- This website never asks users to send tokens or approve token spending.
- We do not promise interest, dividends or revenue sharing for holding BHCT.

6. Tokenomics

This chapter describes the current on-chain state and a proposed allocation. Current values are exactly as read from the chain; the proposed allocation will be disclosed and this chapter replaced in a new version once the foundation confirms it. How supply is distributed, used and recovered is described in Token economy (https://nvex.attackgo.com/en/whitepaper/token-economy).

6.1 Supply

Item	Details
Initial supply	1,000,000,000 BHCT (minted once to the treasury wallet at issuance)
Further minting	None. The contract has no mint function.
Burning	Holders can burn their own tokens; total supply falls by the amount burned.
Admin recovery	Mints nothing; it only moves tokens to the fixed treasury wallet.

6.2 Current allocation

Item	Share	Description
Treasury wallet (unallocated)	100%	Most of the supply is in the treasury wallet, and no allocation plan has been decided yet. Tokens outside the treasury appear in circulating supply, read from the chain.

Table 6. Allocation · as of November 5, 2026 at 1:56 AM UTC

6.3 Allocation plan (proposed)

Allocation categories and shares, and lockup/vesting schedules, have not been confirmed. Below is a proposal aligned with the token economy design; once the foundation confirms it, it will be reflected together with a disclosure. The shares used in the ecosystem (contribution rewards, services, market expansion) are set at 65%, so most of the supply flows to contribution rewards and ecosystem use.

Pool	Proposed share	Amount (BHCT)	Purpose	Spending · lock (proposed)
Ecosystem contribution rewards	40%	400,000,000	Verified contribution rewards for creators, brands and the community	Spent through quarterly budgets, annual distribution cap (10% of the start-of-year balance), recovered tokens reallocated
Ecosystem services · partners	15%	150,000,000	Service catalog launch, production, education and hub partner programs, events such as Creatopia	Spent after each program plan is disclosed
Market expansion	10%	100,000,000	Country-by-country entry across Southeast Asia after the Philippines, and Asian corridor programs	Spent after each market plan is disclosed
Platform · security	10%	100,000,000	Zetaverse integration, payout and reconciliation tools, third-party security audit	Spent by development stage
Foundation reserve	15%	150,000,000	Legal and regulatory work, emergencies, long-term operations	Locked for 12 months, then disclosed on each use
Team · contributors	10%	100,000,000	Team and advisers contributing to the foundation and integration	Locked for 12 months, then released monthly over 36 months

Once confirmed, it will be published in this order:

1. Disclose the allocation plan and the wallet address of each pool on the disclosure board.
2. Move tokens to the pool wallets; when locks are applied, disclose the locked amounts and release times.
3. Reflect the confirmed allocation and schedule tables in a new version of this whitepaper, and add the pool wallets to the disclosed wallets for the circulating-supply calculation.

6.4 Lockup · vesting

No lockup or vesting is currently set on-chain. Nothing has been allocated, so there is no release schedule.

The proposal locks the team/contributor share for 12 months and then releases it monthly over 36 months, and locks the foundation reserve for 12 months. The contract's balance lock is an admin function that blocks transfers until a set time, so each release tranche would be locked with its amount and time and disclosed. The nature and risks of this permission are described as they are in Contract and permissions (https://nvex.attackgo.com/en/whitepaper/contract). The ecosystem contribution reward pool is not locked; instead, the annual distribution cap and quarterly budgets limit how fast it is spent.

6.5 Circulating supply

Circulating supply = current on-chain total supply − balances of disclosed wallets

The only disclosed wallet today is the treasury wallet. This website reads both values from BNB Smart Chain every few minutes and serves the same values through the supply API.

6.6 Reward payout principles

- Rewards are sent directly from the treasury wallet to the wallet a member linked to their account.
- Every payout records its transaction hash and is marked complete only after the on-chain transfer (sender, recipient, amount) is verified.
- Payouts are disclosed every month.

6.7 Proposed token flow and reallocation

The flow is: approved quarterly budget from the reward pool → payout of reviewed contribution rewards → creator's voluntary holding or use → service order payment received at the ecosystem receiving wallet → confirmation after refund and dispute periods → reallocation to the reward pool.

Step	Proposed handling	Verification records
Budget approval	Approve a quarterly budget within the annual distribution cap and per-campaign limits from the reward pool	Approver, budget, period, recipients and available balance
Review · payout	Confirm contribution reward conditions separately from contractual compensation	Campaign, review, recipient account and wallet, amount and transaction hash
Voluntary use	Creator selects a catalog service or decides not to spend	Agreed order, price, capacity and deadline
Service receipt	Receive order payments at the ecosystem receiving wallet published in the catalog; providers receive the cash price of secured slots	Order-level receipt, delivery, cancellation and refund status
Confirmation	Confirm only receipts whose refund and dispute period has ended; hold the rest	Confirmed, held and refunded amounts
Reallocation	Move confirmed amounts to the reward pool after monthly reconciliation and approval (Stage 1 proposal: 100%)	Wallet-to-wallet transaction hash, monthly reconciliation and approval

Refund reserves and disputed amounts on hold are never counted as available reward funding. Service payments are voluntary transfers chosen by users, distinct from the contract's admin recovery function that can operate without holder approval. This proposal does not connect business revenue to market purchases or burning.

If the operator or a partner ever receives BHCT directly under a contract, the amount and timing of any return to the foundation would be set by that contract and reallocated only after it actually arrives. Registering the reward pool and the ecosystem receiving wallet as disclosed wallets leaves the circulating-supply formula (total supply − disclosed wallet balances) unchanged, and internal reward-budget balances are managed separately from on-chain circulating supply.

6.8 Separate cash flow and service costs

These are proposed fund flows once agreements and funding are secured, not a statement of confirmed brand revenue or cash support today.

Cash flow	Proposed purpose and separation
Actual brand payments → contractual payouts and business costs	Contractual creator compensation, production and operating costs, and any service budget agreed by contract; settled separately from additional BHCT rewards
Separately agreed foundation · operator · sponsor budgets → service supply	Cash costs of available services, provider payments and cost reserves
Agreed cost budget → gas · refund handling	Agree in advance who funds and handles network costs for payouts, returns and refunds

Returning service tokens to the foundation does not create cash for staff, facilities, editing or localization. Token receipts and reallocation would not be presented as new market demand or cash revenue. Additional rewards would not be expanded before service costs, refund budgets and capacity are secured.

6.9 Decisions required for allocation and payout caps

These are the items to settle before confirming the proposed allocation above and starting the first distribution. It does not change current allocation or lockup facts; approved quantities and schedules would be reflected after separate decisions and disclosure.

Decision	Items to set before starting
Reward budget · period	Total approved limit from existing treasury, spending period, approvers and unused-budget treatment
Campaign · recipient caps	Campaign limit, eligibility and amount rules, and duplicate-payout prevention
Service capacity	Fixed catalog BHCT amounts, secured slots, supply costs and existing booking obligations
Cash · refund funding	Funding commitments and receipt verification, costs, gas, refunds and dispute reserves
Wallets · reconciliation	Treasury, reward pool, ecosystem receiving and refund wallets and responsible parties, disclosure scope and monthly approval
Allocation · release policy	Confirm the proposed shares and lock periods, separate pool wallets and register them as disclosed wallets; the current absence of locks remains until confirmed

The proposed new-payout cap would not exceed the smallest of the unused available approved reward budget, the campaign cap, and service capacity affordable with secured slots and cash-cost budgets. Capacity would use fixed catalog BHCT amounts and cash costs per service, rather than cash

conversion at a token market price. Existing approved payouts, bookings, refund and dispute reserves would be accounted for first.

The review would also consider previous reward payouts not yet reconciled with service orders and prospective usage demand. Holding tokens does not always secure stock of a particular service; catalog capacity and booking conditions would apply, while accepted bookings retain their agreed terms.

Monthly reconciliation and budget balances

Closing reward-pool balance = opening balance + confirmed amounts reallocated from the ecosystem receiving wallet − completed payouts

The ecosystem receiving wallet would separately record opening balance, order receipts, refunds, amounts held, reallocations and closing balance. Refund and dispute reserves would be withheld from available balances, with reconciliation preventing the same quantity being counted twice across the reward pool and service wallet. Reallocation is a wallet-to-wallet move within existing supply, not newly minted tokens.

7. Token details

BHCT's basic facts and official contract address. The table below is drawn from the coin settings and values read from BNB Smart Chain.

Token name	BHCT (BHCT)
Chain · standard	BNB Smart Chain · BEP-20 · Chain ID 56
Official contract	0xbf139b1463c86e9d05934338dd1f731b25af68ef
Decimals	18
Total supply (on-chain)	1,000,000,000 BHCT
Circulating (on-chain)	0 BHCT
Disclosed wallets · Treasury	0x6f8fe169c9f9bfba0c345005ed63dc9533922027
Block explorer	https://bscscan.com/token/0xbf139b1463c86e9d05934338dd1f731b25af68ef

Table 7. BHCT basic facts (read from BNB Smart Chain) · as of November 5, 2026 at 1:56 AM UTC

> Fake tokens using the same name and logo may exist. Only trust the official contract address above.

7.1 Contract characteristics

- **Fixed supply**: there is no function to mint more after the initial issuance.
- **Burnable**: holders can burn their own tokens, reducing total supply by the same amount.
- **Managed**: freeze, lock, pause and recovery permissions exist. See Contract and permissions (https://nvex.attackgo.com/en/whitepaper/contract).
- **No upgrades · no transfer fee**: no proxy upgrade and no transfer tax.

7.2 Supply API

Supply is published through a public API so everyone uses the same values. Values are read directly from BNB Smart Chain.

Endpoint	Returns
`/api/supply`	Total and circulating supply (JSON)
`/api/supply/total`	Total supply (number only)
`/api/supply/circulating`	Circulating supply (number only)

8. Technology

BHCT is a BEP-20 contract on BNB Smart Chain. The NVEX website reads chain values directly and connects to users' wallets only through signatures. The website's server holds no private keys. Zetaverse's separate operator handles campaigns and review; exchange of campaign results and BHCT integration with the NVEX website are being designed alongside the proposed partnership scope.

8.1 Components

Component	Role
BNB Smart Chain	The blockchain holding the BHCT contract (chain ID 56). Transfers, balances and permissions are recorded here.
BHCT contract	BEP-20 token with fixed supply, burning, and freeze, lock, pause and recovery permissions
NVEX website	Reads chain values; runs My BHCT, account wallet linking, reward records, disclosures and the supply API
Zetaverse platform	A separate operator runs and reviews creator–brand campaigns. BHCT integration with NVEX is at the proposed partnership and design stage
User wallets	Wallets users manage themselves (MetaMask, Trust Wallet, etc.)

8.2 Reading chain values

The website reads total supply, disclosed wallet balances, and each address's balance, locked amount and frozen status directly from public BNB Smart Chain nodes. Values are refreshed every few minutes and shown with the time they were read. Transaction history links to the block explorer (BscScan).

8.3 How wallet linking works

Linking a wallet to an account means signing a message in the EIP-4361 (https://eips.ethereum.org/EIPS/eip-4361) (Sign-In with Ethereum) format.

- The message contains the site address, the account, the wallet address, the chain ID, a one-time value (nonce), and issue and expiry times (10 minutes).
- The server checks that the signature belongs to that wallet. Smart-contract wallets are verified with ERC-1271 (https://eips.ethereum.org/EIPS/eip-1271).
- One wallet can be linked to only one account, and a used message cannot be reused.

8.4 Reward payouts and verification

The following is the payout-tool workflow available on the NVEX website. Actual campaign rewards require the operator's reviewed results and previously announced payout conditions; the exchange and approval process will be set by partnership contracts and policies.

1. An NVEX administrator registers a reward confirmed for payout (member, amount, reason).
2. An authorized administrator signs the BHCT transfer from the treasury in their own wallet.
3. The website records the transaction hash and, once it is in a block, checks that the receipt's transfer record (sender, recipient, amount) matches what was registered.
4. A match is marked paid; a mismatch or failure is recorded as failed. Payouts are disclosed.

8.5 Proposed exchange of campaign results

The design maintains a boundary between reviewing source campaign evidence and verifying token payouts.

Data to exchange	Proposed purpose
Campaign identifier · terms version	Identify the campaign and participation and review conditions applied
Work and review outcome · approval basis	Link the operator's findings with the reason for payout approval
Recipient account · linked wallet · amount	Compare the payout recipient with NVEX's wallet ownership verification record
Payout status · transaction hash	Check duplicates, unprocessed items and failures and connect them with on-chain records

Exchange permissions, change and correction history, duplicate prevention and retention scope are items to agree with the operator. Personal and commercial source data would be handled within the scope needed for the work; public disclosures would distinguish information approved for payout and transaction reporting. This does not describe a currently operating automatic review or settlement integration.

Proposed service orders would also record order identifiers, catalog versions, fixed amounts, providers, receiving wallets, delivery, refunds and returns for reconciliation. The current token contract is not described as implementing order-specific escrow, automatic service settlement or automatic reward reallocation for this business. Managed-token transfers are separate from business ledgers and approval work.

8.6 Supply API

`/api/supply` (JSON), `/api/supply/total` and `/api/supply/circulating` (number only) are open to everyone. Values are read from the chain and cached for one minute. Responses include the calculation method, the excluded disclosed wallets and the time read.

8.7 Security principles

- The website's server holds no private keys and never asks users to send tokens or approve spending.
- The admin area is limited to admin accounts, and repeated failed logins are blocked.
- A published whitepaper version cannot be edited in the admin area, and published disclosures are protected against edits and deletion in the database. Changes are made through new versions or correction disclosures.

9. Contract and permissions

BHCT is a managed contract with a fixed supply. The permissions holders should know about are disclosed as they are.

9.1 Permissions

Function	Who	What it does
Mint	Nobody	There is no mint function after the initial issuance.
Burn	Holders	Holders can burn their own tokens.
Freeze address	Admin role	Blocks transfers from a given address.
Lock balance	Admin role	Locks part of an address's balance until a set time.
Pause	Admin role	Stops all transfers.
Recover	Recovery role	Moves a set amount to the fixed treasury wallet without the holder's approval, regardless of freezes, locks or pauses.
Upgrade	Nobody	No proxy upgrade.
Transfer fee	None	No transfer tax.

9.2 Wallets holding permissions

Role	Address
Treasury	`0x6f8fe169c9f9bfba0c345005ed63dc9533922027`
Default admin	`0x6f8fe169c9f9bfba0c345005ed63dc9533922027`

The treasury and the default admin are currently the same wallet, and it also holds the admin and recovery permissions. Any change to the wallets holding permissions will be disclosed.

9.3 How permissions are used

- Freeze, lock, pause and recovery are used only to protect holders and the ecosystem, such as responding to hacks or theft, lawful requests, or handling mistaken transfers.
- Each use is disclosed with its reason and transaction hash. Where immediate disclosure isn't possible (for example, while cooperating with an investigation), it is disclosed once it can be.

9.4 Security

- There is no third-party audit report yet. If an audit is performed, the report will be disclosed and reflected in this chapter.
- Transactions, supply and permission wallets can be checked by anyone on the block explorer.
- The website's server holds no private keys. Reward payouts are signed by an administrator in their own wallet.

10. Foundation and disclosures

10.1 NVEX Foundation

The NVEX Foundation manages BHCT and the NVEX website and is pursuing a BHCT integration partnership with Zetaverse's separate operator. The foundation's registered name and location will be published in this chapter and on the disclosure board once confirmed.

Role	Details
Token management	Treasury and contract permissions, BHCT payout tools and records
NVEX website	Balance lookup, account wallet linking, reward history and supply API
Proposed integration partnership	Agree exchange of reviewed results, BHCT terms of use and payout procedures with the operator
Disclosure	Whitepaper, disclosures and supply data

10.2 Separate Zetaverse operator

The Zetaverse operator handles the platform and creator programs, brand matching, and the contract, delivery and performance review process. The operator's legal entity information and partnership scope will be published once verified and confirmed.

Campaign contracting parties, payment receipt and settlement, review approval, BHCT payout responsibility and funding, refunds, dispute handling and information exchange will be set in contracts and policies and announced before participation. NVEX's payout tools are distinct from the operator's campaign review role; pursuing a partnership does not assign every settlement and payout responsibility to either party.

10.3 Proposed collaboration and handoffs

Work	Role in the proposed collaboration	Handoff and verification records
Brand requirements · contracting	The operator organizes terms with brands and creators and identifies contracting parties	Brief, contract, work scope and rights
Delivery · review	The operator collects materials and records confirmation by the contractually designated approver, such as the brand	Deliverables and reasons for revisions, approval or rejection
Reward terms · budget	The operator and NVEX agree conditions, funding, approval and payout responsibility	Campaign reward terms, budget and approval basis
Token payout · verification	NVEX's tools register confirmed recipients and an authorized wallet signs	Linked wallet, amount and reason, on-chain receipt
Disputes · incidents	Assign contacts and handoffs separately for review or contract issues and account or transfer issues	Submission reasons, verification, reconsideration and outcome
Disclosure · change management	Both parties check consent and confidentiality; NVEX manages token disclosures	Disclosure scope, change dates and reasons, correction records

As collaboration develops, the intended disclosures cover legal entities, roles and official contacts, markets and eligibility, settlement and payout parties and funding, review and dispute processes, information handling and case-study consent. Business results would be checked against contracts, delivery, review and settlement records; ownership and rights transfers would be distinguished from cooperation on services.

10.4 Proposed service receipt · return · shutdown responsibilities

Work	Responsibility and funding to specify in contracts
Catalog supply	Actual operator or partner scope, slots, costs, deadlines and support contact
Optional additional rewards	NVEX and operator budget approval, review and payout roles, and separation from contractual compensation
Service receipt · refunds	Official receiving-wallet management and reconciliation, non-delivery, cancellation, completed work, gas, refund contact and reserves
Foundation returns · reallocation	Returnable amounts and timing, refund and dispute reserves, voluntary transfer and approval after actual receipt
Suspension · exit	Responsible parties, funding, deadlines and notices for confirmed unpaid rewards, accepted bookings and refunds

Return and refund duties would be separated by order and contract. The proposed model does not use refund funding first to sustain reward reuse. It contains no promise that the foundation will buy back holders' tokens for cash if the business collaboration ends.

10.5 Disclosures

The following are posted with a date on the disclosure board (https://nvex.attackgo.com/en/disclosures). Published disclosures are never edited; corrections are posted as new correction disclosures.

- Issuance and supply changes (including burns and recoveries)
- Allocation plans and allocation wallets
- Reward payouts
- Changes to contract permissions and permission wallets
- Starting, changing or stopping a use
- Scope and progress of integration with the Zetaverse operator, and terms of use
- New versions of this whitepaper
- Security incidents and responses

10.6 Documents and versions

The whitepaper, risk notice, terms of use and privacy policy are versioned. Published versions are never edited; they are replaced by new versions, and changes to the whitepaper are kept in the changelog (https://nvex.attackgo.com/en/whitepaper/changelog).

10.7 Official channels and contact

Official channels and a contact address will be announced once confirmed.

11. Roadmap

This is the Zetaverse operator's business roadmap alongside NVEX's BHCT integration plans. The operator validates its business model through campaigns; NVEX is pursuing token integration at verified touchpoints, subject to partnership scope and regulatory review.

Phase	Details	Status
Stage 1 · Creator-to-brand infrastructure	The operator validates a system for assessing and developing creators, placing them on real briefs and recording results. The Philippines is the first proof market for the cross-border campaign model. NVEX prepares BHCT, the whitepaper, disclosures and payout tools, and pursues integration.	In progress
Stage 2 · Creator IP · production · fan participation	The operator expands into IP, production, fan participation and digital commerce around creators proven in Stage 1. NVEX pursues BHCT integration for uses whose partnership, rights and regulatory conditions have been set.	Planned
Stage 3 · Regional creator hubs	The operator aims to develop hubs for training, production and live commerce and a regional partner network, starting with Southeast Asia. BHCT integration scope is reviewed separately.	Planned

11.1 Stage 1 progress

Item	Status
Zetaverse operating in Malaysia	Done
Creatopia online creator event (October 17, 2026)	Done
BHCT issued (BNB Smart Chain)	Done
NVEX website, My BHCT and disclosure board launched (November 2026)	Done
Whitepaper v1.0 published (November 4, 2026)	Done
14-day campaign-ready program	In progress
Early Philippines pilot	In progress
Connecting creator BHCT rewards to campaign results	In progress
Confirming the allocation plan and disclosing the first quarterly distribution budget	Planned
First paid campaign and repeat briefs	Planned

11.2 Stage 1 building blocks

Building block	What it creates	Evidence needed
Creator acquisition	Reliable creator supply by niche and region	Conversion and cost by source
Profile · readiness scoring	A searchable, comparable creator inventory	Scores that track real execution
Creator journey · packaging	Campaign-ready profiles, samples and commercial discipline	Completion rates and reliability
Brand workflow	Search, proposal, contract, offer, delivery, report	One real brief completed end to end
Campaign data	Performance history by creator and brief	Better matching and less operating friction
Commercial engine	Campaigns, affiliate, live commerce, services	Sustainable unit economics and repeat demand

The operator's Stage 1 has three goals: on the creator side, a first measurable cohort; on the brand side, valid campaign opportunities; and commercially, a path from the first paid campaign to repeat briefs.

11.3 Gates for starting and expanding the BHCT service pilot

Stage	Conditions	Evidence
Before launch	Signed partnership, catalog prices, slots and deadlines, secured cash for services, gas and refunds, agreed reward allocation, wallets and responsibilities	Contracts, budget approvals, supply and funding verification, cancellation, abuse, dispute and security conditions
Limited operation	A defined cohort and period complete one campaign from brief to review, contractual compensation, optional reward, voluntary order and service delivery	Linked work, consent, payout, order, delivery, refund and on-chain records
Reconciliation · review	Monthly reconciliation, usage, repeat-use, cost and budget metrics, analysis of rejection, cancellation, disputes and errors	Token and cash ledgers, comparative results and changes to catalog or terms
Expand or suspend	Approve new budgets only within service capacity, secured funds and demonstrated benefits	Expansion basis or a plan to stop new rewards and bookings and handle exit

Fabricated work, duplicate accounts or payouts and self-dealing orders would be checked through evidence and order-campaign reconciliation, with hold reasons and appeal procedures. The proposal is

to stop new additional rewards and bookings when supply or cash funding is insufficient, or serious security, non-delivery or reconciliation issues arise, then announce handling responsibilities and scope. External audit and permission safeguards are pre-launch review items; this does not claim a completed audit or a multisignature wallet today.

Proposed pilot exit · partnership shutdown handling

Confirmed unpaid additional rewards would be handled by the parties and funding specified in campaign approvals and agreements. Accepted service bookings would be fulfilled as agreed or handled under the disclosed same-quantity refund process. Exceptions for completed work and gas would be limited to advance consent. Refund reserves for related bookings and disputes would not be reallocated. Exit notices would identify the cutoff for new requests, payout, booking and refund contacts and deadlines, and support and appeal channels.

Unused BHCT in a wallet would remain at the holder's discretion. Ending a partnership would not by itself expire tokens or guarantee cash buyback or replacement services.

11.4 Gate from Stage 1 to Stage 2

The proposed gate is for the operator to gather the following evidence before selective expansion, rather than advancing on sign-up scale alone. Review periods and numerical thresholds would be set using pilot data and contractual conditions.

Area	Evidence to assess	Decision for the next stage
Repeatable supply	Recruitment, assessment, activation and placements using consistent criteria	Check dependence on personal connections or one-off events
Completion · reliability	Brief, contract, delivery, approval, report and settlement history	Check whether readiness assessments predict delivery, quality and reporting
Paid · repeat demand	Actual paid transactions, follow-up briefs and contracts	Separate free pilots and inquiries from repeat commercial demand
Campaign economics	Business compensation, direct costs, workload, cancellations and revisions	Assess whether repeat operations are sustainable
Rights · operating controls	Content, music and likeness rights documentation, contracts, data and dispute procedures	Assess readiness for production, licensing and fan products

Only creators and activities supported by that evidence would be considered for Stage 2. Launching a BHCT use also requires integration agreements, budgets, payout responsibility, rights and regulatory conditions; progression of the business stage does not launch all token features at once.

11.5 What Stage 2 adds

Stage 2 selects creators and IP proven in Stage 1 to build production, rights and fan relationships that can be used beyond a single campaign.

Expansion area	Work to develop	Contractual and operating conditions
Short-form · short drama · branded production	Content planning, production, distribution and reuse	Production contributions, copyright, music and likeness permissions, distribution and reuse scope
Creator products · brands	Product collaboration, merchandise and direct-to-fan sales	Production and distribution costs, quality, delivery, returns and use of brands and content
Licensing · selected rights participation	Separate production, management or licensing agreements for proven IP	Existing rights holders, licensed or acquired rights, territories, duration, media, cost and revenue settlement, termination
Fan communities · premium experiences	Members-only content, events, experiences and repeat participation	Content, schedule, duration, eligibility, cancellation, non-delivery, refunds and personal data handling
Tokenized access · digital participation	Review of BHCT integration for selected membership and fan access	Eligibility verification, access terms and duration, transferability, and distinction from contractual rights

The intended model separately records what content or experience a fan can use and for how long, and the IP rights held by the creator or operator. IP ownership and business revenue participation are matters for individual contracts and do not arise automatically from holding BHCT.

Optional card · payment infrastructure

Crypto cards and payment rails in the business materials are optional areas for review to support creator payouts and cross-border commerce. Items to assess include issuer and payment-provider roles, countries supported, KYC/AML, fund flows and settlement, conversion, fees and limits, errors, loss, cancellations and user information handling. Providers, conditions and whether to launch would be determined and announced separately, distinct from the NVEX website's current wallet ownership verification and balance lookup.

11.6 Stage 3 regional ecosystem

Regional hubs would be considered by connecting resources to verified creator supply and brand demand, rather than expanding premises first.

Infrastructure	Collaboration concept	Items to check before execution
Physical · digital creator hubs	Connect training, production, editing, live commerce and brand-demo resources	Operators for equipment, space, staff and online services, usage terms, costs and demand
Schools · universities	Talent pipelines through education, projects and portfolios	Institutional roles, teaching and practice scope, participant protection, consent and outcome records
Local governments · cities	Creator-economy workforce development and local programs	Public purpose, operating and budget responsibilities, selection, reporting and agreement scope
Brand · production network	Connect briefs, production capabilities and distribution opportunities	Repeat demand, delivery, review and rights criteria, regional partner roles
Cross-border corridor	Korean content and talent, Chinese technology and commerce, Southeast Asian execution	Country-specific localization, contracts, rights, data and settlement conditions

Cooperation with schools, institutions and local governments is a concept, not a statement that particular organizations have joined or signed agreements. Partners and scope would be disclosed after regional validation and operating conditions are reviewed.

In the long run, Zetaverse aims to grow beyond a campaign platform into regional creator infrastructure that connects creator supply, performance data, production, IP, rights, brands and institutional partnerships.

> Moving to the next phase is decided not by sign-ups or token price, but when qualified creators are repeatedly acquired and placed and the economics are confirmed. Phase dates will be disclosed once set.

11.7 Company capital-market strategy and BHCT

Zetaverse's business strategy is to build recurring revenue, performance data, contracts and IP, audited financial statements and governance before considering strategic or institutional capital and, in the long term, a possible IPO or direct listing. This is not a confirmed listing plan, date or valuation.

Review sequence	Business evidence to build
Prove the operating model	Repeatable creator acquisition, brand demand and campaign economics
Build assets	Networks, commercial data, technology, contracts and selected IP participation
Prepare governance	Financial records, ownership structure, decision and rights documentation, regulatory response
Consider strategic capital	The role and conditions of capital for scaling a proven business
Explain independent business value	Evidence distinguishing recurring monetization from production and rights activities
Review public-market readiness	Review and professional processes concerning scale, growth, profitability and governance

The company's capital-market strategy is separate from BHCT's terms of use. Holding BHCT carries no promise of company shares, dividends, IP ownership, IPO allocations or listing proceeds. Any services, memberships or access offered through the token will be described in separate partnership terms and terms of use.

12. Risks

Please read the risks below and decide for yourself before receiving, holding or moving BHCT. The full text is in the risk notice (https://nvex.attackgo.com/en/risk).

Risk	Summary
Price volatility and loss	Value may fall sharply or be lost entirely.
Liquidity	There is no guarantee you can trade or convert at the time or price you want.
Business	Uses are in preparation or design; plans may change or not happen. Without uses and a cash budget in place, distributed tokens may go unused and circulation may not happen, and the proposed allocation shares and distribution cap may change as they are confirmed.
Admin permissions	Freeze, lock, pause and recovery permissions exist and are currently held by one wallet.
Smart contract	Undiscovered bugs may exist, and there is no third-party audit report yet.
Security and impersonation	Losses from leaked keys, phishing or fake tokens cannot be reversed.
Blockchain network	Network outages or fee spikes can delay or fail transactions.
Regulation	Rules differ by country and may change, which can restrict use in some places.
Information and plans	Plans in this whitepaper and in disclosures may change.
Tax	Receiving or moving tokens may be taxable; handling tax is your responsibility.

13. Conclusion

BHCT is the NVEX Foundation's token, for which an integration partnership with Zetaverse's separate operator is being pursued. Its role is to reward the contributions that build Zetaverse's bottleneck resource, creator supply brands can actually use, and to have those rewards spent on preparation services and access in the ecosystem and then return to the reward pool to be distributed again. A fixed supply with no minting, disclosed wallets and monthly disclosures let anyone check this circulation from outside.

Today most of the supply is in the treasury; creator rewards are in preparation with payout tools in place and the other uses are in design. Zetaverse operates in Malaysia, recruits creators through Creatopia (October 17, 2026) and the 14-day campaign-ready program, and is running an early pilot in the Philippines. On the NVEX website, balance lookup, account wallet linking, reward history, disclosures and supply data already work.

The NVEX Foundation is pursuing agreement with the operator on partnership scope, roles and terms of use, and validation of BHCT integration against reviewed campaign results. Whatever is decided will be published through disclosures and new versions of this whitepaper.

13.1 Coming next

- Confirmation of the proposed allocation (shares, lock schedules, pool wallets) and the first quarterly distribution budget
- Confirmation of the Stage 1 pilot figures (reward amounts, catalog prices and capacity, first quarterly budget), service providers and monthly circulation metrics
- Start conditions for each use and pilot results
- Applied readiness, service-deliverable and KPI criteria, and evidence from actual operations
- Zetaverse operator information, integration partnership scope, and settlement and payout conditions
- Participant counts for Creatopia and the 14-day program, and Philippines pilot results
- The foundation's registered name and location, official channels and a contact address
- Third-party security audit results (if an audit is performed)

14. How to use

What you can do with BHCT on this website today, and how.

14.1 Available now

Feature	What it does	Where
Balance lookup	Connect a wallet or enter an address to see balance, locked amount and frozen status	My BHCT (https://nvex.attackgo.com/en/wallet)
Add to wallet	Add the BNB Smart Chain network and the BHCT token to your wallet	My BHCT (https://nvex.attackgo.com/en/wallet)
Link a wallet to your account	Sign a message proving the wallet is yours to link one wallet to your account	My BHCT (https://nvex.attackgo.com/en/wallet)
Reward history	See BHCT rewards paid by the foundation and their transactions	My BHCT · Account
Disclosures	Supply, payouts, permission changes and more	Disclosure board (https://nvex.attackgo.com/en/disclosures)

14.2 Prepare a wallet

1. Install a wallet that supports BNB Smart Chain (MetaMask, Trust Wallet, etc.).
2. Write your recovery phrase on paper and keep it somewhere safe. The NVEX Foundation will never ask for your recovery phrase or private key.
3. Connect your wallet in My BHCT (https://nvex.attackgo.com/en/wallet) and follow the prompts to add BNB Smart Chain and BHCT.

14.3 Link a wallet to your account

1. Sign up as a member and log in.
2. Connect your wallet in My BHCT and select "Link to account".
3. Read the confirmation message in your wallet and sign it. The message contains the site address, your account, the wallet address and an expiry time.
4. One wallet can be linked per account, and you can unlink it at any time.

> This is only a message signature proving the wallet is yours. It does not send tokens or approve spending, and it costs no gas.

14.4 Receive rewards

When the foundation pays a reward, BHCT arrives in the wallet linked to your account. Payouts and transaction hashes are shown in My BHCT and on your account page.

14.5 Beware of impersonation

- Official announcements are made only on this website and official channels. Official channels will be announced once confirmed.
- Sales, airdrops, first-come giveaways and wallet-connection requests sent by private message may be scams.
- Before adding or receiving the token, check that the contract address matches the official one in Token details (https://nvex.attackgo.com/en/whitepaper/token).

15. FAQ

Where can I get BHCT?

This website does not sell BHCT. We are preparing with the Zetaverse operator to connect campaign and event results to BHCT rewards. Eligibility, amounts, review criteria, payout responsibility and funding will be announced before the first payout. Confirmed recipients will receive payouts in the wallet linked to their NVEX account, and payouts will be disclosed. Linking a wallet alone does not make someone eligible for rewards.

Why is BHCT needed? Couldn't cash or points do this?

Contractual pay and costs stay in cash, as they are now. BHCT does what cash does poorly: rewarding contributions that create supply quality, such as finishing training, delivering on time and reporting, under the same rules across companies and countries, and letting creators own those rewards in their own wallets and spend them again on ecosystem services. One company's points can be issued at will and are hard for other partners to accept; BHCT has a fixed supply and payout records anyone can check.

How do tokens circulate?

They are distributed from the reward pool for verified contributions, and when creators spend them on services or access they return to the ecosystem receiving wallet. Receipts whose refund and dispute period has ended are reallocated to the reward pool and become the next contribution rewards. In Stage 1 the proposal is to reallocate all recovered tokens rather than burn them. Details are in Token economy (https://nvex.attackgo.com/en/whitepaper/token-economy).

Do rewards or prices change when the BHCT price changes?

No. Rewards and service prices are both set in BHCT amounts, so the same reward pays for the same service regardless of any market price. The figures are adjusted each quarter based on circulation metrics; changes are disclosed and reflected, with their as-of date, in the tables in the whitepaper and on the token page.

Must I hold BHCT to participate in or be selected for campaigns?

No. General matching, participation, basic readiness assessment and selection are separate from holding or buying tokens. The proposed Clinic and Production Support are optional additional services. Paying for them does not guarantee brand deals, preferential selection or higher trust scores.

What are the proposed uses for rewarded BHCT?

The proposal starts by reviewing Creator Profile Clinic and Production Support that can be supplied under agreements. Actual services, prices, capacity, deadlines, providers, receiving wallets and cancellation terms would be published before pilot use. Current prices and capacity are in the catalog

tables on the token page (https://nvex.attackgo.com/en/token#token-economy) and in Token economy (https://nvex.attackgo.com/en/whitepaper/token-economy). This is not a notice that these services have launched.

Do all service tokens return to the reward pool?

In the Stage 1 proposal, all receipts confirmed after their refund and dispute period are reallocated to the reward pool. Refund reserves and disputed amounts still in their period are held, and where the operator or a partner receives tokens directly under a contract, only amounts actually returned and received count. This is voluntary payment and settlement, distinct from forced admin recovery, and does not mean automatic burning, new market demand or cash revenue.

Is connecting my wallet safe?

This website only asks for a message signature to confirm the wallet is yours; it never asks you to send tokens or approve spending. If your wallet shows a transfer or approval request, don't sign it and check the address again.

How is circulating supply determined?

It is the current on-chain total supply minus the balances of disclosed wallets such as the treasury. Nothing has been allocated yet, so most of the supply is in the treasury; tokens that leave it, for example as rewards, become circulating supply. The current value is shown as read from the chain in Token details (https://nvex.attackgo.com/en/whitepaper/token).

How does the whitepaper change?

Each change is published as a new version, recorded in the changelog and announced on the disclosure board. Earlier versions are never edited.

Is this an investment product?

No. This whitepaper and website are not investment advice, and we do not promise or forecast BHCT's price or returns.

16. Glossary

Term	Meaning
BNB Smart Chain	The blockchain network BHCT is issued on (chain ID 56)
BEP-20	The token standard on BNB Smart Chain
Contract	The on-chain program holding the token's rules (issuance, transfers, permissions)
Treasury	The foundation wallet that received the initial supply; recovered tokens also return here
Disclosed wallet	A wallet published by the foundation and excluded from circulating supply
Circulating supply	Current on-chain total supply minus disclosed wallet balances
Burn	Destroying tokens to reduce total supply
Freeze · lock	Blocking transfers of a whole address or part of its balance
Recover	An admin function that moves a set amount to the treasury
Message signature	A signature proving wallet ownership; not a transfer or approval
Transaction hash	A unique ID for each blockchain transaction, viewable on the block explorer
Disclosure	Material information published by the foundation with a date
Creator Operating System	Zetaverse's way of recruiting, assessing and developing creators, placing them on brand campaigns and recording results
Brief	A brand's request setting out campaign goals, product, market, deliverables and schedule
Readiness	How ready a creator is to take on commercial campaigns, judged by evidence such as profile, samples and reliability rather than follower count
UGC	User-generated content that creators make for brands to use
KPI	A key performance indicator, defined together with its denominator, measurement period and source
Campaign economics	Assessing repeat operating viability from business compensation, direct costs, workload and settlement outcomes
Permission · license	Contractual conditions allowing use of content or IP for a defined scope, duration and media, distinct from ownership
Fan access	Eligibility to use specified content, services or experiences, distinct from company shares or IP ownership

Term	Meaning
Optional additional reward	A proposed BHCT reward separate from contractual compensation and subject to consent, budget and review conditions
Service catalog	An operating document specifying service scope, price, capacity, deadlines, providers, receiving wallets and cancellation terms
Reward-pool reallocation	Moving confirmed amounts in the ecosystem receiving wallet (refund and dispute period ended) to the reward pool after monthly reconciliation and approval
Monthly reconciliation	Matching reward, order, delivery, refund and return ledgers with wallet transactions to verify balances, pending work and reserves
Token economy	The whole structure through which BHCT is distributed, used, recovered and distributed again
Ecosystem reward pool	A disclosed wallet holding BHCT for verified contribution rewards; 40% in the proposed allocation
Ecosystem receiving wallet	The foundation's disclosed wallet that receives BHCT spent on services and access
Contribution reward	BHCT paid for reviewed contributions such as finishing training, reaching readiness, campaign delivery and performance
Brand-designated performance bonus	BHCT a repeat brand attaches to performance criteria, paid by the foundation to creators once the conditions are verified
Annual distribution cap	The limit on a year's distribution: a share (proposed 10%) of the reward pool balance at the start of the year
Recovery rate	The share of tokens distributed in a period that returned to the ecosystem

18. Legal notice

18.1 Not investment advice

This whitepaper provides information about BHCT and Zetaverse and is not investment, financial, legal or tax advice. It does not solicit the sale or purchase of BHCT in any country or region.

18.2 Forward-looking statements

Plans, schedules and design directions in this whitepaper reflect our thinking at the time of writing and may change or not happen. The current published version of this whitepaper and the disclosure board are the latest reference.

18.3 Country restrictions

Virtual-asset regulation differs by country. Check the laws where you live before receiving, holding or moving BHCT, and do not use BHCT where it is not permitted.

18.4 Language

This whitepaper is provided in Korean and English. If the two differ, the Korean version prevails.

Changelog

Published versions of this whitepaper and what changed. PDFs of earlier versions can be downloaded where available.

Version	Issued	Changes
v1.5	2026-11-05	Turned the Stage 1 pilot figures (reward amounts by contribution, service catalog prices and capacity, quarterly distribution budget) into tables linked to the admin settings. Each table shows its status (proposed or confirmed) and as-of date, the token page shows the same values, and quarterly adjustments are made by updating these values with a disclosure rather than publishing a new whitepaper version. Added the principle that prices are set in BHCT amounts and not tied to a market price, with a related FAQ. The figures themselves are unchanged from v1.4.
v1.4	2026-11-05	Added a Token economy chapter: a circular design in which tokens from the fixed supply are distributed only for verified contributions, spent on Zetaverse ecosystem services and access, and recovered to an ecosystem receiving wallet for reallocation to the reward pool. It covers a flow diagram, why BHCT is needed and how it divides work with cash, flows by participant, an annual distribution cap, balancing rules, monthly circulation metrics, a worked example and a staged rollout. Added BHCT's role at each Zetaverse operating step, a proposed allocation and lock schedule in Tokenomics, and proposed Stage 1 pilot figures (reward amounts by contribution, service catalog prices and capacity, a first-quarter budget of 750,000 BHCT and next-quarter adjustment criteria). Allocation shares, the distribution cap and the Stage 1 figures are proposed values and will be disclosed once confirmed.
v1.3	2026-11-05	Defined a proposed operating model using the supplied Zetaverse strategy: roles of brands, creators, the separate operator and NVEX; optional additional rewards; profile-clinic and production-support candidates; separate token and cash flows; voluntary receipts and reallocation; budgets, quotes, refunds, exit procedures and pilot metrics. Distinguished business, token-use and service-exit references. This release does not establish signed agreements, live utility, allocation percentages, unlock schedules or returns.
v1.2	2026-11-05	Expanded the proposed operating model with creator readiness criteria, service outputs, campaign monetization and contract topics, KPI definitions, reward procedures and expansion gates, drawing on the supplied Zetaverse strategy and official descriptions of comparable services. Added the ecosystem detail page, Korean and English PDF links, and English change notes. This release does not establish new allocation figures, operating results or signed partnerships.
v1.1	2026-11-04	Added A4 PDFs in Korean and English and reorganized the chapters into business, ecosystem, token, technology, operations, roadmap, risks, conclusion and appendices. Added technology, conclusion, references and ecosystem component sections. Expanded the operating system, brand deal types, Asian corridor, pilot and roadmap using the supplied strategy. Added utility progress notes and the Preparing status. Clarified that Zetaverse has a separate operator and NVEX is pursuing a BHCT integration partnership. Reorganized roles, campaign workflow, business models, BHCT touchpoints and disclosure plans, separating campaign review from token-transfer verification.

Version	Issued	Changes
v1.0	2026-11-04	First public release covering the Zetaverse ecosystem, proposed BHCT utility, token facts, current tokenomics, contract permissions, disclosure principles, roadmap, risks and legal notices.
